

## GROWING UP

# Seed Variety

We come across many kinds of seeds every day. Whether they be the beans we eat or those found in fruits, seeds come in different shapes, sizes, colours, and forms. But seeds do not just differ in appearance. They also differ in the way they germinate.

Apple seeds, for example, need just above freezing temperatures to germinate.

Pumpkin seeds, on the other hand, cannot germinate in cold temperatures and need warmer soil temperatures.
